

1        ABSTRACT

2

3            A portable workstation ergonomically designed to ease

4        muscle tension for portable computer users is disclosed.

5        The workstation comprises foldably coupled surfaces which

6        provide an easily folding and portable workstation with a

7        raised work surface, which raises, for example, the

8        computer screen and keyboard of a laptop to a more

9        comfortable height for the user. The workstation also

10       includes a raised and tilted surface with a lip to secure

11       items in place on the work surface.
